I am applying for the (full title and qualification of the programme) with the aim of entering MEng Engineering with Business Finance course upon completion. I believe that my current academic knowledge combined with that gained in the (full title and qualification of the programme) course will fully prepare me for the challenging Engineering degree at the (full name of the university).

Since my childhood I have been demonstrating interest to the mechanics and construction of the things around me. For instance, I am a keen constructor of miniature models of cars, ships and planes based on existing designs, as well ones I developed myself. Mathematics and Physics became my favourite subjects and later, in secondary school, gaining knowledge of these subjects has helped me develop the first understanding of the engineering and its importance in the modern world. I have learned that many problems faced by the mankind could be solved with the help of science, namely engineering.

At present, humanity is struggling to solve at least three global problems: hunger, overcrowding and depletion of natural resources. Whenever we seem to have locally solved one problem, we are faced with yet another one. However, I believe that at least two of these problems, hunger and depletion of natural resources, may be solved simultaneously, with the advancement of energy and mechanical engineering. It could allow scientists to develop new types of energy as well as energy-efficient engines that would cause significantly less damage to the environment. With more saved energy, we may be able to produce greater amounts of food, which would help fight hunger. Of course I am very far from being able to design those solutions but I would like to contribute to bringing them into life in the future.

I am certain that the MEng course will allow me to become a good engineer, and it is also important to me that it provides the opportunity to gain knowledge of economics and business through the courses taught by the experts from the (full name of the university). This opens up the possibility to further develop my career, so as to become not only a great expert in the field of engineering, but also a competent businessman. I believe that in the modern society, it is important to have a good understanding of the main economic and financial principles. This is necessary for those responsible for bringing engineering ideas into life as well, as it requires being able to obtain the necessary funding and find business and governmental partners for large scale engineering projects.

I understand that participation in the engineering course at (full name of the university) will be very demanding, and therefore appreciate the importance of successful completion of the (full title and qualification of the programme). Having examined the outlines of core modules, Mathematics and Physics, I believe that my current knowledge would enable me
to successfully follow the curriculum of these courses. I am also looking very much forward to the Science and Society module, which, without doubt, will help me to further develop my understanding of the field I am going to enter. Lastly, my determination and motivation to acquire new knowledge will further help me to succeed in my studies.

In the future, I would like to become an excellent engineer and join the ranks of people whose day-to-day job contributes to the creation of the mechanisms solving global problems. I believe that (full name of the university), an institution recognized worldwide for the quality of its engineering education, would provide me with a strong foundation for my future career. And I will do my best to succeed in this learning.
